

Training Daily Diary – Day 4

Topic Covered Today:

- Introduction to HTML Links and Images
- Creating links using the `<a>` tag
- Understanding the `href` attribute
- Creating internal and external links
- Opening links in a new browser tab
- Adding images using the `<img>` tag
- Understanding `src` and `alt` attributes
- Setting image width and height

Key Learning:

Today I learned how to add links and images to an HTML webpage. Links are used to connect one webpage to another, while images are used to display visual content on a webpage.

The `<a>` tag is used to create hyperlinks in HTML. The `href` attribute specifies the destination of the link.

Example:

```
<a href="https://www.google.com">Visit Google</a>
```

I also learned about different types of links:

- **External links** – Links that point to another website.
- **Internal links** – Links that connect pages within the same website.
- **Email links** – Links that can open an email application.

I learned that the `target="_blank"` attribute can be used to open a link in a new browser tab.

I also learned how to add images using the `<img>` tag.

Example:

```

```

The `src` attribute specifies the image location, while the `alt` attribute provides alternative text if the image cannot be displayed.

Activities / Assignments:

- ✓ Created different hyperlinks using the `<a>` tag.
- ✓ Practised using the `href` attribute.
- ✓ Added external links to different websites.
- ✓ Created links between HTML pages.
- ✓ Practised opening links in a new browser tab.
- ✓ Added images to an HTML webpage using the `<img>` tag.
- ✓ Practised using `src` and `alt` attributes.
- ✓ Adjusted image width and height.
- ✓ Created a simple webpage containing both links and images.

Personal Reflection for Day 4:

Today's session helped me understand how links and images make webpages more useful and interactive.

I learned how to connect different webpages using hyperlinks and how to add images to improve the visual appearance of a webpage. I also understood the importance of the `alt` attribute when working with images.

After completing the practical exercises, I became more comfortable with using the `<a>` and `<img>` tags. These concepts will be useful when creating complete websites and will also help me later when working with CSS and Bootstrap.
