

Training Daily Diary – Day 2

Topic Covered Today:

- Introduction to **HTML Tables**
- Understanding the structure of an HTML table
- Creating rows and columns
- Using table headings and table data
- Using table borders and basic table attributes
- Creating a simple student information table

Key Learning:

Today I learned about **HTML Tables**, which are used to display information in rows and columns on a webpage.

- The <table> tag is used to create an HTML table.
- The <tr> tag is used to create a **table row**.
- The <th> tag is used to define a **table heading**.
- The <td> tag is used to define **table data**.

I learned that a table is created by placing rows inside the <table> element and adding headings or data inside each row.

I practised creating a basic table using the following structure:

Day	Seminar		
	Schedule		Topic
Monday	Begin	End	
	8:00a.m.	5:00p.m.	Introduction to XXL
Tuesday	8:00a.m	11:00a.m	Validity: DTD and Relax NG
	11:00a.m.	2:00p.m.	Xpath
	2:00p.m.	5:00p.m.	XSL Transformations
Wednesday	8:00a.m.	12:00p.m.	XSL Formatting Objects

I also learned how tables can be used to organise structured information such as student records, product details, employee information, and other data.

Activities / Assignments:

- ✓ Created a basic HTML table.
- ✓ Practised creating multiple rows using the `<tr>` tag.
- ✓ Added headings using the `<th>` tag.
- ✓ Added information using the `<td>` tag.
- ✓ Created a student information table containing name, age, course, and email.
- ✓ Practised adding borders to make the table easier to read.
- ✓ Viewed the completed table in a web browser and checked its structure.

Personal Reflection for Day 2:

Today's session helped me understand how HTML tables are used to organise and display information on a webpage.

I learned the purpose of the `<table>`, `<tr>`, `<th>`, and `<td>` tags and understood how they work together to create rows and columns.

After practising a student information table, I became more comfortable with creating structured data in HTML. This knowledge will also be useful when working with CSS and Bootstrap to design and style tables in web applications.
